desktop apps → cloud apps

Advantages of cloud apps

ubiquitous presence
of applications and data

delegation of
updates & backups
to service provider

no worries about losing work if your machine crashes

easy interaction & **sharing** with other people

no need to **install** software

access from everywhere (laptop, work, internet café, ...)

Disadvantages of cloud apps

Where are your files stored?

In which legislation?

hosting is nontrivial

data might not be **encrypted**

safety of personal data & interaction

dependency on infrastructure & net connection

costs money (premium features)

can we combine
the best of both worlds?

rich desktop apps
social
easily deployable
data under my control
accessible from every device

1 all data under my control

own server

home computer + **PageKite**

company server

ownCloud provider

ownCloud

Cloud Services
under your control

owncloud package

ownCloud in a box

Published by Cornelius Schumacher
Homepage at <http://owncloud.org>

Based on **openSUSE 11.4** 32-bit x86

ownCloud in a box packages ownCloud as an appliance, so you can easily run it in a virtual environment, as a live system or install it on a disk.

Run the appliance, go to [http://\[yourservername\]/owncloud](http://[yourservername]/owncloud) and login as admin with the password owncloud42. Change the password in the admin interface and use the URL, which is shown there to access ownCloud via WebDAV.

Release notes

Fixed default network configuration to use DHCP by default. For other configurations run "zypper install yast2-network" and use the YaST network configuration.

 Files Document Editor

This is an ODF test document opened in ownCloud. :)

This is the initial result of a project that I've been working on to integrate the WebODF JavaScript library as an ODF file viewer and basic editor (hopefully) for ownCloud. At a couple of days of work, I have opening, viewing, and basic editing, without saving ;(however, finished. Unfortunately, there is still much more work to do. I plan to implement as many of the features available in the upstream as possible, and maybe more if the support is there. Upstream has/had a funded developer working on their code for a couple of months, so hopefully we will see some

improvement. I am not sure how far this will go in terms of functionality; it may just be a basic viewer/editor, I really have to look into the upstream feature set, and the lack of explicit documentation means that I will have to slog through some of the WebODF source, or at least get into contact with the upstream developers, which I plan to do. A lot of the more advanced features will most likely come from our conversations, but I have high hopes.

As a result of this, saving and complex formatting might be a problem, but I hope to try and find a way to enable this functionality

If anyone has any comments, feedback, or ideas for external libs or other code resources, or even hopes to contribute, at the moment you can contact me on the #owncloud channel on freenode, my nick is cogsu, and I should be on that channel a good amount of the time, or just post to this blog entry, and I will check upon the comments.

I am in the process of getting the sources moved to my Github, or to a personal clone on projects.kde.org. updates will come to when I have a significant amount of work put together, and I will be happy to invite testers to try the code, or even contribute.

Upstream: <http://webodf.org/> -- Be sure to check out their demo to see a little of the possibilities behind this project
